

## CyberSecurity Management System (CSMS):

This document defines the cybersecurity policies used in the CyberSecurity Management System (CSMS).

### 1. Purpose

CSMS is designed to manage cryptographic operations securely.

### 2. Access Control

Only authorized users are permitted to access sensitive modules.

### 3. Cryptography Policy

AES is used for file encryption.

RSA is used for key generation and digital signatures.

### 4. Signature Validation

All signed files must be verified using public key validation.

### 5. Compliance

All operations follow standard cybersecurity best practices.
